

ABSTRACT

A disk drive includes a main unit and an outer case (2). The main unit includes a disk-driving unit for rotating a disk, a data-reproducing unit for reproducing data from the disk, and a drive unit for moving the data-reproducing unit relative to the disk. The 5 outer case (2) has a top wall (3a) and a rear wall (3c). The top wall (3a) opposes the main unit. The rear wall (3c) extends from the rear edge of the top wall (3a), is gently inclined and covers the rear part of the main unit. The rear wall (3c) serves as a guide when the disk drive is inserted into a slot of an apparatus. In addition, the metal plate used to form the outer case (2) can be smaller than otherwise.
